# 1 Exercises – Introduction

## 1. Eukaryotic and prokaryotic cells

Cells are the most basic building blocks of all living organisms. Several aspects differ between prokaryotic and eukaryotic cells.

- (a) Which one of the two cell types, prokaryotes or eukaryotes, lacks a distinct nucleus?
- (b) Can eukaryotes be unicellular?

### 2. Cell organelles

A cell consists of a number of specialized subunits called organelles. Answer the most suitable organell that matchs the explanation.

- (a) The key role of this organelle is to produce energy rich molecules for the cell.
- (b) It is a membrane-enclosed organelle. It contains genetic material called chromosomes.

#### 3. **DNA**

Deoxyribonucleic acid (DNA) is an important molecule that stores generic information. DNA consists of four different nucleotides - Adenine (A), Cytosine (C), Guanine (G), and Thymine (T).

(a) What is the DNA sequence when its opposite strand is ACCGT?

#### 4. Central dogma of molecular biology

The central dogma of molecular biology describes the flow of genetic information by three processes - Replication, Transcription, and Translation.

- (a) What are the two main molecules involved in transcription?
- (b) What are the two main molecules involved in translation?

#### 5. **RNA**

Ribonucleic acid (RNA) conveys genetic information from its corresponding DNA to ribosome where proteins are synthesized. Similar to DNA, RNA has four different forms - Adenine (A), Cytosine (C), Guanine (G), and Uracil (U).

(a) What is the transcribed RNA sequence when the corresponding DNA sequence is TATAGC?

#### 6. Genetic code

The genetic code defines how three RNA nucleotides, called codon, should be translated into an amino-acid.

First	Second position			Third	
position	Т	С	A	G	position
Т	F	S	Y	С	Т
	$\mathbf{F}$	$\mathbf{S}$	Y	$\mathbf{C}$	C
	${ m L}$	$\mathbf{S}$	Stop	Stop	A
	L	$\mathbf{S}$	Stop	W	G
С	L	Р	Н	R	Т
	${ m L}$	Р	Η	$\mathbf{R}$	C
	${ m L}$	Р	Q	$\mathbf{R}$	A
	L	Ρ	Q	$\mathbf{R}$	G
A	I	Т	N	S	Т
	I	${ m T}$	N	$\mathbf{S}$	C
	I	${ m T}$	K	$\mathbf{R}$	A
	M	${ m T}$	K	$\mathbf{R}$	G
G	V	A	D	G	Т
	V	A	D	G	C
	V	A	$\mathbf{E}$	G	A
	V	A	E	G	G

A	Ala	Alanine
$\mathbf{C}$	Cys	Cysteine
D	$\stackrel{\circ}{\mathrm{Asp}}$	Aspartic acid
$\mathbf{E}$	$\overline{\mathrm{Glu}}$	Glutamic acid
$\mathbf{F}$	Phe	Phenylalanine
G	Gly	Glycine
$\mathbf{H}$	His	Histidine
I	Ile	Isoleucine
K	Lys	Lysine
L	Leu	Leucine
$\mathbf{M}$	Met	Methionine
N	$\operatorname{Asn}$	Asparagine
Ρ	$\operatorname{Pro}$	Proline
Q	$\operatorname{Gln}$	Glutamine
$\mathbf{R}$	$\operatorname{Arg}$	Arginine
$\mathbf{S}$	Ser	Serine
$\mathbf{T}$	$\operatorname{Thr}$	Threonine
V	Val	Valine
W	$\operatorname{Trp}$	Tryptophan
Y	Tyr	Tyrosine

- (a) Stop codons are special codons that terminate the protein synthesis. Specify all three stop codons.
- (b) Both one-letter and three-letter abbreviations are often used instead of the full names. What is the three-letter abbreviation of Tyrosine?
- (c) What is the one-letter abbreviation of the amino acid that is synthesized from the codon AGA?
